Summary

Results-driven DevOps Engineer experienced in designing resilient AWS infrastructure and scalable container platforms. Specialized in modular Terraform provisioning with state locking, Amazon EKS cluster management, and progressive GitOps deployments via Argo CD. Demonstrated success in eliminating environment drift, optimizing compute resource allocation, securing container delivery workflows, and minimizing MTTR across production microservice architectures.

Technical Skills

Cloud and Infrastructure: AWS (EKS, VPC, IAM, EC2, S3, CloudWatch), Terraform, AWS CLI
CI/CD: Jenkins, GitHub Actions, Argo CD
Containers and Orchestration: Docker, Kubernetes
Monitoring and Observability: Grafana, Prometheus, New Relic
Code Quality and Security: SonarQube
Artifact Management: JFrog Artifactory, Nexus
Scripting and Automation: Shell (Bash), Python
Collaboration and Tracking: Git, GitHub, Jira, Postman

Experience

DevOps Engineer May 2024 – Present
LTIMindtree *Hyderabad, India*

- Architected declarative GitOps delivery pipelines using GitHub Actions and Argo CD, managing blue/green and canary release strategies across multi-account AWS environments; implemented dynamic health checks, self-healing synchronization, and instant rollback triggers that reduced Mean Time to Recovery (MTTR) by 45%.
- Engineered enterprise-grade, reusable Terraform modules with remote state locking via S3 and DynamoDB, enforcing least-privilege IAM policies, VPC subnet isolation, and security group egress controls; accelerated staging-to-production environment spin-up from 3 days to under 40 minutes while eliminating infrastructure drift.
- Migrated 8+ stateless microservices to Amazon EKS using Helm charts and multi-stage Docker builds; configured Horizontal Pod Autoscaling (HPA), resource limits, pod disruption budgets (PDBs), and Ingress controllers (ALB), cutting compute idle spend by 22% while ensuring 99.9% application availability during traffic spikes.
- Enforced shift-left security gates within CI workflows, integrating SonarQube static analysis (SAST), dependency scanning, and JFrog Artifactory / Amazon ECR image vulnerability scanning; blocked non-compliant binaries and high-severity CVEs prior to artifact registry promotion, reducing pre-release defect leakage by 35%.
- Integrated AWS Secrets Manager and HashiCorp Vault / External Secrets Operator (ESO) with Kubernetes workloads, replacing hardcoded environment variables with dynamically rotated credentials and centralized audit logging.
- Implemented AWS Route 53 latency-based routing, ACM SSL/TLS programmatic certificate renewal, and AWS Application Load Balancers (ALB) with path-based routing rules, maintaining sub-millisecond network overhead across microservices.

DevOps Intern Aug 2023 – Oct 2023
LTIMindtree *Remote*

- Streamlined routine server maintenance, log rotation, and environment diagnostics across Linux servers by developing 10+ robust Bash scripts, saving 2+ hours of manual toil weekly.
- Standardized Git branching strategies (Gitflow) and PR review policies for a 10-member team, minimizing merge conflicts and speeding up sprint release cycles.
- Optimized container packaging with multi-stage Docker workflows across development and staging lifecycles, ensuring consistent artifact delivery and slashing release errors by 40%.

Education

Vellore Institute of Technology 2023
Bachelor of Technology – Electronics and Communication Engineering *Vellore, India*
